**LITHIUM AUSTRALIA CONTINUES TO DEVELOP
SUSTAINABLE AND ETHICAL SUPPLY SOLUTIONS
FOR THE ENERGY METALS INDUSTRY
QUARTERLY REPORT FOR SEPTEMBER 2018**

HIGHLIGHTS

- Recommissioned Brisbane pilot plant commences production of lithium-ion cathode material.
- Sadisdorf drilling confirms pervasive lithium mineralisation on the doorstep of the European EV industry.
- Lepidolite Hill confirmed as a feed source for SiLeach[®] pilot plant.
- Generation 2 Sileach[®] pilot plant at ANSTO successfully produces lithium chemicals from mine waste.
- Transfer of 100% of Sadisdorf project approved by Saxony Upper Mining Authority.
- Cathode material sent to China for commercial evaluation.
- Changes to Australian government R&D policy result in Lithium Australia reviewing the planned scale of its generation 3 SiLeach[®] pilot-plant.

SUBSEQUENT EVENTS

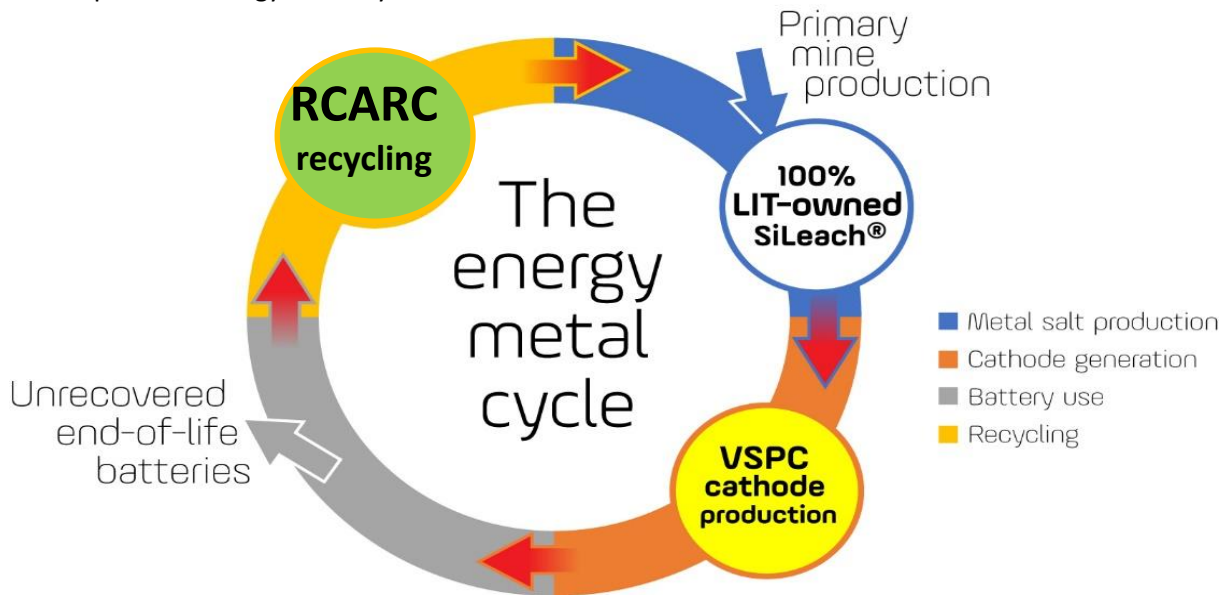

Lithium Australia secures Youanmi lithium project option.

MEDIA CONTACTS

DEVELOPMENT STRATEGY

Lithium Australia NL (ASX: LIT) has advanced its aim of developing an integrated company capable of addressing and capitalising upon all major sectors of the lithium supply chain, and in so doing closing the loop on the energy metal cycle.

Key elements of the company's strategy include the following.

- 100%-owned SiLeach® technology is capable of converting mine waste to lithium chemicals.
- VSPC technology can convert lithium chemicals to lithium-ion battery cathode materials of superior quality.
- Recycling technology will recover valuable metals, including lithium and cobalt, from spent batteries, thereby closing the loop on the energy metal cycle.

Lithium Australia's developing technology is complemented by its growing resource base, which – coupled with SiLeach® – can breathe new life into stranded assets. A prime example is the Sadisdorf deposit in Germany (see below), in which tin and lithium mineralisation are associated.

Patent authorities having confirmed that SiLeach® is novel, inventive and has industry application, Lithium Australia is pursuing a significant research and development programme to achieve its goal of commercialising the process. To that end, the company is packaging the funding necessary to construct a large-scale pilot plant (LSPP), which it hopes will be the world's first hydrometallurgical facility to produce lithium chemicals from a feedstock of silicates (mine waste).

During the quarter, following its acquisition of VSPC Ltd (formerly the Very Small Particle Company Ltd), Lithium Australia finalised the recommissioning of that facility for the production of cathode materials, a lucrative element in the lithium-ion battery production cycle. Samples of cathode material produced at the VSPC pilot plant will be reviewed by international battery manufacturers.

By integrating its SiLeach® and VSPC processes, Lithium Australia aims to establish a pathway from mine waste to lithium-ion battery manufacture. To that end, during the quarter it succeeded in converting waste rock into a lithium chemical at its SiLeach® pilot plant at the ANSTO Minerals facility in Lucas Heights, New South Wales. That chemical subsequently went to the VSPC facility to be used in battery manufacture. Lithium Australia hopes to achieve a world first by transforming waste rock into a lithium-ion battery.

SILEACH® PILOT PLANT – UPDATE

The Australian federal government's policy change with respect to research and development has had a considerable impact on Lithium Australia's plans for the future. Given that the current policy significantly reduces the support provided for developing new technologies, the company is overhauling its research and development activities in order to expedite its programmes.

Despite the extra engineering requirements involved in resizing the LSPP to reduce capital costs, Lithium Australia is confident that the studies required to commit to construction of the plant will be completed in the coming quarter. Those plans are well advanced.

One of the principal design criteria for any pilot plant is incorporation of currently available industrial components indicative of a positive production history. It ensures that operations can be scaled up to commercial capacity for the specified application. This will be vital in re-scaling the LSPP.

Plant location will also affect both capital and operating costs, not just with respect to direct costs but also the R&D assistance packages available and the taxation regimes in place in various jurisdictions. Unfortunately, an Australian location now seems less favourable when compared with many other jurisdictions. Siting of the LSPP must balance these important financial considerations against intangibles such as the ability to manage R&D activities taking place offshore.

At present, Lithium Australia's preferred supply model is obtaining lithium mica from the waste streams (historical dumps and tailings) of currently operating mines; however, other supply opportunities are also being evaluated.

CATHODE MATERIALS FROM VSPC

Lithium Australia has completed its acquisition of VSPC, which creates advanced cathode materials of superior quality for lithium-ion batteries. The VSPC facility encompasses:

- proprietary technology for the production of lithium-ion battery cathode materials;
- a comprehensive pilot plant, and
- advanced laboratory and testing facilities.

VSPC technology begins with the cathode metals in a solution from which the cathode nanoparticles are precipitated. The process is compatible with solutions produced when hard-rock minerals are processed to recover lithium as carbonate or lithium hydroxide. Potentially, having cathode materials originate direct from such solutions removes two steps in the process of their manufacture, capitalising on the value-add that results from progressing lithium chemicals to cathode materials.

Lithium Australia is currently investigating such seamless production of cathode materials from hard-rock minerals, via hydrometallurgical front-end processes that include its own 100%-owned SiLeach® process and the L-Max® process of Lepidico Ltd, for which LIT has exclusive rights in Western Australia. Lithium Australia's LSPP is designed to facilitate this via both the SiLeach® and L-Max® processes, which together could result in a significant value uplift in the lithium-ion battery production cycle.

EXPLORATION ACTIVITIES – SADISDORF PROJECT, GERMANY

Originally, Lithium Australia planned to earn an interest in the Sadisdorf lithium/tin resource in a joint venture with Tin International AG (see [ASX announcement](#) 25 March 2017).

Lithium Australia subsequently advised that terms had been agreed in relation to its acquisition of 100% of the Sadisdorf resource from Tin International AG on 11 June 2018, subject to any required regulatory approvals. The regulatory approvals were gained during the September quarter, with all formalities now complete.

Sadisdorf is an historic tin mine in Saxony, Germany, close to the border with the Czech Republic. The style of mineralisation is a greisen (altered granite), with the tin mineralisation enveloped by a pervasive lithium-mica alteration. Application of Lithium Australia's SiLeach[®] technology provides an opportunity to realise the value of both the lithium and the tin, with the former contained within minerals otherwise considered waste.

A source of lithium for the European EV industry

Significantly, the Sadisdorf resource is located close to planned lithium-ion battery production facilities aimed at servicing the burgeoning electric vehicle (EV) industry in Europe. The Sadisdorf site is also well serviced by established infrastructure and well placed for reagent supplies – attributes that would enable development of the resource to the stage of lithium chemical production and, with the addition of VSPC technology, production of cathode powders to the European EV battery industry.

Maiden lithium resource estimate completed

CSA Global, a leading international mining consultancy, has estimated an Inferred Mineral Resource at Sadisdorf of 25 million tonnes grading 0.45% Li₂O (see Table 1 below), based on re-analysis and re-interpretation of historical drilling and underground sampling. Reporting was in accordance with JORC 2012 (see [ASX announcement](#) 7 December 2017 and Retraction Statement on 1 June 2018 in regard to production target).

Work is currently underway to better define this production target.

Classification	Domain	Tonnes (Mt)	Li (%)	Li ₂ O (%)
Inferred	Inner greisen	17	0.22	0.47
Inferred	Outer greisen	8	0.20	0.43
Inferred	Total	25	0.21	0.45

Note: the Mineral Resource was estimated within constraining wireframe solids defined above (with a nominal 0.15% Li cut-off). The Mineral Resource is reported from all blocks within these wireframe solids. Differences may occur due to rounding.

Table 1. Inferred Mineral Resource estimate for Sadisdorf.

Resource modelling has confirmed that the dormant tin mine at Sadisdorf, which contains significant lithium mineralisation, can be considered a polymetallic deposit with value contributions from lithium, tin and tungsten. Moreover, application of SiLeach[®] has the potential to provide significant by-product credits (for example, potassium sulphate fertiliser and sodium silicate).

Figure 1. LIT managing director Adrian Griffin observes preparations for drilling at Sadisdorf.

A maiden drilling programme commenced at Sadisdorf (Figure 1), with the aim of improving the resource definition and facilitating a resource upgrade. To date, three drill holes have been completed, as shown in Table 2 below.

Drill hole ID	X (metres)	Y (metres)	Z (metres)	Planned Azimuth	Planned Dip	Planned length	Actual length
SDDH-17-01T	5404692.0	5633054.4	592.6	88.2°	-86.0°	310 m	310.0 m
SDDH-17-02T	5404703.4	5633052.3	592.4	280.2°	-66.6°	150 m	100.8 m
SDDH-17-02TA	5404703.4	5633052.3	592.4	280.2°	-66.6°	150 m	150.0 m

Coordinate system: DHDN / 3-degree Gauss-Kruger zone 5.

Table 2. Holes completed for maiden drilling programme at Sadisdorf.

YOUANMI PROJECT

Lithium Australia has expanded its extensive lithium holdings in Australia with the acquisition of acreage in the prospective Youanmi region in Western Australia. There, the company has taken an option over the Youanmi lithium project, located in the Archean Yilgarn Block, some 450 kilometres northeast of Perth (Figure 2).

The project, which consists of three exploration licences (ELs), hosts abundant lithium pegmatites which intrude layered mafic rocks that also host vanadium-rich magnetite horizons.

The three ELs have been secured via the completion of a binding heads of agreement with private exploration company Diversity Resources Pty Ltd (Diversity). Details of the option are outlined in the ASX release dated 27 September 2018.

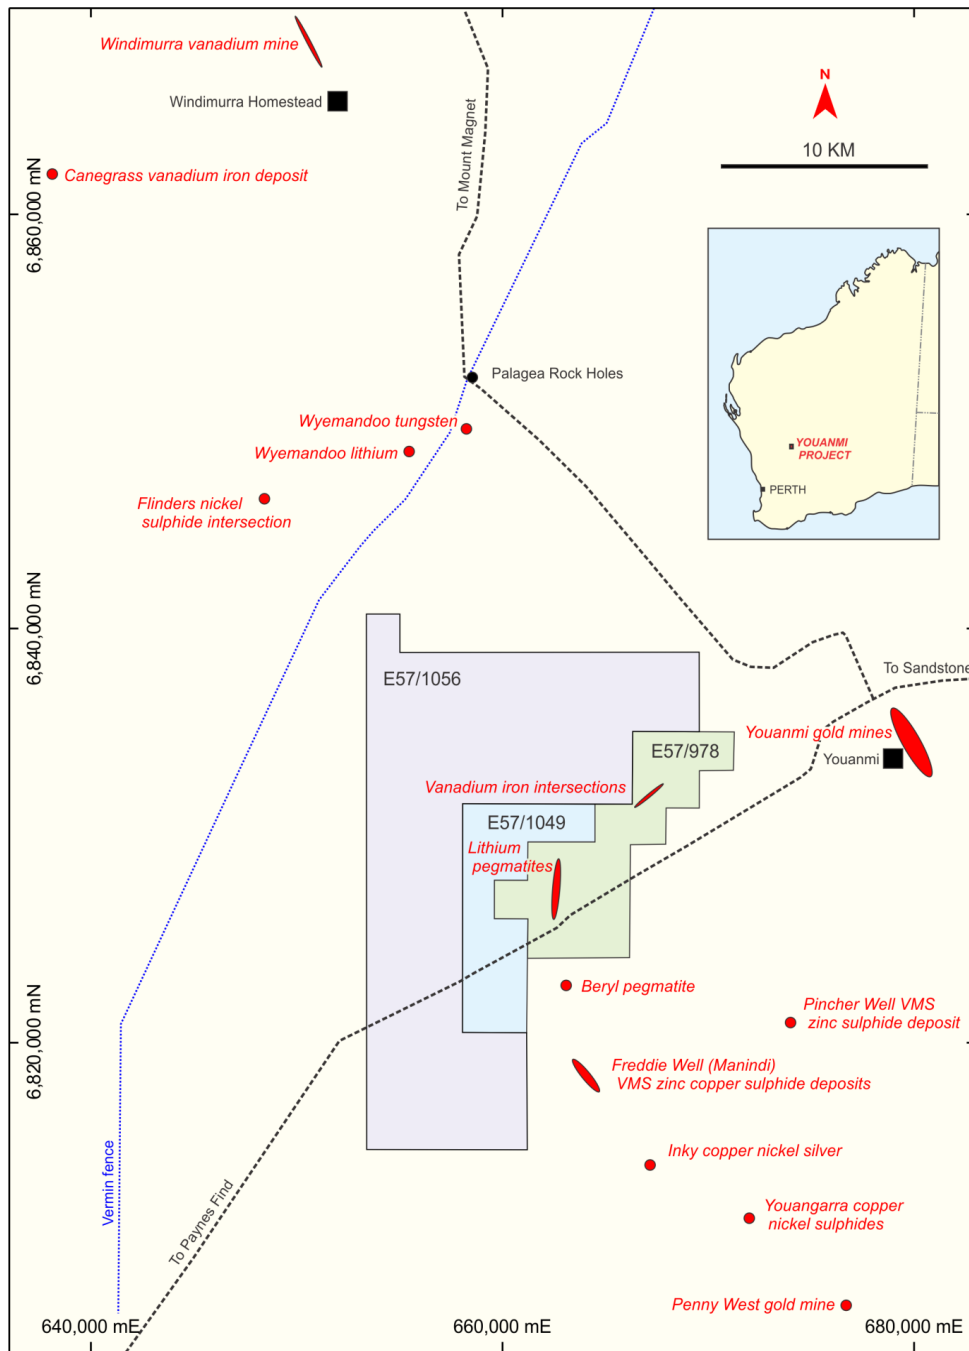

Figure 2 - Youanmi Project Location Map

OTHER OPPORTUNITIES

Lithium Australia continues to explore opportunities in tantalum, tungsten, cobalt-manganese, graphite and rare-earth metals, with a view to directing further exploration efforts on currently held ground, and is considering the acquisition of other quality Australian and overseas properties.

CORPORATE

At the moment, the Arena Investors, LP convertible note facility, as described [in the ASX release dated 1 March 2018](#), is not the ideal funding mechanism for Lithium Australia's requirements. Consequently, that facility has been terminated. The company will continue evaluating financing options that complement its strategic agenda and will update the market as appropriate.

RECYCLING RESEARCH (UPDATE)

As the market for power storage – in particular lithium-ion batteries – matures, recycling will become a global necessity. Much of what drives battery recycling is the value of the cathode metals, cobalt especially. Although current recycling practices recover most of the base metals, lithium recovery is close to zero. The reason for this is simply the processing technology preferred by the companies doing the recycling. In other words, it can be resolved by improving processing options.

Lithium Australia is evaluating the logistical chain for lithium-ion batteries from 'cradle to grave'. The aim is to determine the deportment of all components and develop a strategy that maximises the recovery of all of them at the end of the batteries' useful life. Aided by university research, that work has already begun. The aim is to finalise a flow sheet for testing during 2018.

ABOUT LITHIUM AUSTRALIA NL

Lithium Australia aspires to 'close the loop' on the energy metal cycle by ensuring an ethical and sustainable supply of those metals to the battery industry. To that end, the company has not only assembled a portfolio of lithium projects and alliances but also developed hydrometallurgical extraction processes designed to convert *all* lithium silicates (including mine waste) to lithium chemicals. Subsequently, those chemicals will be used to produce advanced components for the lithium-ion battery industry. The final step in closing the loop involves recycling spent batteries and e-waste to recover the energy metals within. Through this unity of resources and innovation, Lithium Australia seeks to vertically integrate lithium extraction and processing.

Competent Persons' Statement – Lithium Mineral Resources – Sadisdorf

The information in this announcement that relates to *in situ* lithium Mineral Resources for Sadisdorf is based on and fairly represents information compiled by Mr Thomas Branch under the direction and supervision of Dr Andrew Scogings, in accordance with the requirements of the JORC Code 2012. Dr Scogings is a full-time employee of CSA Global Pty Ltd and takes overall responsibility for the Mineral Resource estimate and associated report. Dr Scogings is a Member of both the Australian Institute of Geoscientists and Australasian Institute of Mining and Metallurgy and has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration, and to the activity he is undertaking, to qualify as a Competent Person in terms of the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code 2012)*. Dr Scogings consents to the inclusion of such information in this announcement in the form and context in which it appears. Lithium Australia confirms that it is not aware of any new information or data that materially affects the information included in this announcement, and in the case of the Sadisdorf Mineral Resource estimate the company confirms that all material assumptions and technical parameters underpinning the estimates in the 7 December 2017 and 1 June 2018 announcements continue to apply and have not materially changed.

Competent Persons' Statement – Eichigt Germany

The information contained in the report that relates to Exploration Results, together with any related assessments and interpretations, is based on information compiled by Mr Albert Gruber on behalf of Mr Adrian Griffin, Managing Director of Lithium Australia and has been supervised by Mr Phillip Schiemer, Exploration Manager for Lithium Australia. Mr Schiemer is a Member of both the Australian Institute of Geoscientists and the Australasian Institute of Mining and Metallurgy and has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code 2012)*. Mr Schiemer consents to the inclusion in this report of the matters based on Mr Gruber's data in the form and context in which it appears. Lithium Australia is not aware of any new information or data that materially affects the information in this report.

Competent Person's Statement – Lithium Mineral Resources – Australia

The information in this report that relates to Australian exploration results, together with any related assessments and interpretations, is based on information compiled by Mr Adrian Griffin on behalf of Lithium Australia NL. Mr Griffin is a member of the Australasian Institute of Mining and Metallurgy and has sufficient experience relevant to the styles of mineralisation under consideration, and to the activity they have undertaken, to qualify as Competent Persons, as defined in the *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (2012 edition)*. Mr Griffin consents to the inclusion in the report of the matters based on their information in the form and context in which it appears. Lithium Australia is not aware of any new information or data that materially affects that contained herein.

Forward Looking Statements

This report contains forward-looking statements. Forward-looking statements are subject to a variety of risks and uncertainties beyond the company's ability to control or predict which could cause actual events or results to differ materially from those anticipated in such forward looking statements.

Notes

1. The quarterly report provides a basis for informing the market on how the entity's activities have been financed for the past quarter and the effect on its cash position. An entity that wishes to disclose additional information is encouraged to do so, in a note or notes included in or attached to this report.
2. If this quarterly report has been prepared in accordance with Australian Accounting Standards, the definitions in, and provisions of, AASB 6: Exploration for and Evaluation of Mineral Resources and AASB 107: Statement of Cash Flows apply to this report. If this quarterly report has been prepared in accordance with other accounting standards agreed by the ASX pursuant to Listing Rule 19.11A, the corresponding equivalent standards apply to this report.
3. Dividends received may be classified either as cash flows from operating activities or cash flows from investing activities, depending on the accounting policy of the entity.
